****Software Tools**** While Photoshop is powerful and very flexible, you don't have to be a graphic designer to use the program, and the command interface won't be intuitive to anyone. On the other hand, Photoshop Lightroom is specifically built for photographers (and even includes a camera that lets you connect and use it on your computer directly from the camera). Lightroom is easier to use, but it does require a little more learning. Elements, which is the inexpensive version of Photoshop, doesn't require much effort to learn, but you have to be willing to learn the basic information about the program as well as the differences between the different versions. In fact, Elements is easy to use because it is optimized for photographers. Photoshop Lightroom and Elements are only two of the programs in which you can do image editing, but you can choose the tools most suitable for your work. **## **Tricks with Adobe Software**** The following two sections give you a few ways to use Photoshop and offer a few tricks that you may not be aware of. You may also find these interesting, but some people have trouble getting the hang of editing on a computer. For this reason, there are many tutorials designed to show you how to navigate Photoshop and the layers feature.

Histamine-induced GABAA receptors in the hippocampal CA1 region: role of GABAB and type I metabotropic glutamate receptors. Many effects of histamine, including cellular proliferation, production of tumor necrosis factor- α , and release of free Ca²⁺ from intracellular stores, are mediated through GABAA receptors. Histamine also activates GABAB receptors and has been shown to potentiate responses to GABA-mimetics in the rat dorsal hippocampus. The authors examined the effects of histamine on GABAA and GABAB receptors and on glutamate release in the rat hippocampal CA1 region by using a superfusion system to apply agonists and antagonists for up to 10 min. Agonist activation of GABAA receptors in the hippocampus was assessed by measuring tonic gamma-aminobutyric acid (GABA)_A receptor-mediated Cl⁻ currents. Histamine (5-100 nM) increased Cl⁻ currents, whereas physalaemin (H3-specific agonist; 5-300 nM) decreased Cl⁻ currents. The potentiation of GABA-induced Cl⁻ current by 10-100 nM histamine was eliminated by 1 μ M pertussis toxin or by pretreatment with 100 nM cycloheximide, suggesting a requirement for new protein synthesis. Conversely, activation of GABAB receptors by baclofen (10-100 nM) reduced (P
